

Level P for Pre & Early Kindergarten

- Orally & visually presented items
- No print recognition required

Level P

Subtests:

- **Phonological Awareness**
 - Sound Matching
 - Rhyming
- **Visual Skills**
 - Picture Matching
 - Picture Differences
- **Concepts**
 - Verbal Concepts
 - Picture Categories
- **Listening Comprehension**

Level K

for Kindergarten, Early & Transitional First Grade

- Measures early reading skills, such as knowledge of letters & words

Level K

Subtests:

- **Phonological Awareness**
 - Sound Matching
 - Rhyming
- **Early Literacy Skills**
 - Print Awareness
 - Letter Recognition
 - Same & Different Words
- **Phoneme-Grapheme Correspondence**
- **Word Reading**
- **Listening Comprehension**

Level 1 for First Grade

Subtests:

- **Word Reading**
- **Word Meaning**
- **Sentence Comprehension**
- **Passage Comprehension**
- **Listening Comprehension**

Level 2 for Second Grade

Subtests:

- **Word Reading**
- **Word Meaning**
- **Sentence Comprehension**
- **Passage Comprehension**
- **Listening Comprehension**

Level 3 for Third Grade

Subtests:

- **Word Reading**
- **Vocabulary**
- **Sentence Comprehension**
- **Passage Comprehension**
- **Listening Comprehension**

Levels 4 through A

Subtests:

- **Vocabulary**
- **Sentence Comprehension**
- **Passage Comprehension**
- **Listening Comprehension**

Some Statistics About Reading

- **10+ million children in the US are considered poor readers**
 - **80% of students with Learning Disabilities are impaired in reading**
 - **90% of these children have problems with decoding skills**
 - **70% of poor readers in the 3rd grade remain poor readers in the 9th grade**
 - **83% of reading delayed students showed signs of language difficulties at ages 3 -4**
 - **Reading problems occur with equal frequency in boys and girls**
 - **Schools identify 4 times more boys than girls**
- 

A QUICK STATISTICS LESSON

Some Statistics you will see in the reports and how to use them.

Use the Normal Curve in your handouts to follow along.

- **Raw Score = number correct** **NP = Number Possible** **'p' value = simply the percent correct**
- **Percentile: NOT an equal interval score - cannot be compared from test to test or year to year or child to child - simply shows what percent of the norm group scored at or below this child's score. 50 %tile is the mean.**
- **NCE: Normal Curve Equivalent - an equal interval metric that divides the normal curve into 99 equal portions - can compare test to test, year to year, child to child, can be arithmetically manipulated. 50 NCE is the mean**
- **Stanines: an equal interval score, larger divisions than NCE, not as discrete a metric, much growth can take place and stanine might not change.**
1-3=below average, 4-6=average, 5 is the mean, 7-9=above average
- **Standard Scores - have a mean of 100 and match the metrics used on most cognitive and language tests used in Special Education testing.**
- **Grade Equivalent: Don't use!! Example: If a 3rd grade child has a 12.3 GE, it simply means if a 12th grade student took that 3rd grade test with the extra years of education but still testing 3rd grade skills, it is the score the 12th grader would get.**
- **GSV - Growth Scale Value - a vertical score from Grade 1 - adult that shows student growth overtime.**

Description of Results

A stanine score converts a raw score (total number correct) to a single-digit number between 1 and 9, which makes test performance easier to understand. If the stanine score is 1, 2, or 3, the test performance is considered below average or reflects a weak performance on the specific set of tasks or subtests. If the stanine score is 4, 5, or 6, the test performance is considered average. If the stanine score is 7, 8, or 9, the test performance is considered above average and reflects strong performance. Looking at stanine scores helps readily identify reading strengths and/or needs.

The **Comprehension Composite** measures the ability to comprehend a sentence as a whole unit as well as multiple sentences in an extended reading passage. Jin Jin's weak performance indicates a possible lack of word reading and vocabulary skills, a fluency problem, some problem with the specific material, or an inability to use comprehension strategies.

Vocabulary measures the ability to decode phonetically regular words, to recognize common sight words, and to understand word meaning without the benefit of contextual clues. Jin Jin's weak performance on the Vocabulary subtest indicates a possible lack of opportunity to learn word meanings.

The **Total Test** raw score can be converted to multiple normative or derived scores for overall reading skill assessment. Jin Jin's weak Total Test performance suggests that assistance is needed to improve reading skills.

Listening Comprehension measures linguistic understanding without printed cues. Jin Jin's average performance indicates oral language skills commensurate with the development level represented for Level 5.

Betty recently took the Group Reading Assessment and Diagnostic Evaluation (GRADE). The GRADE is a diagnostic tool designed to see what pre-reading or reading skills have been learned and what skills need to be taught. The information in the boxes below shows Betty's test results. The Stanine chart reflects Betty's most recent test administration and shows his performance on specific GRADE subtests or tasks. The Growth Scale Value (GSV) graph demonstrates Betty's reading progress over time. The data point or mark on this graph represents Betty's current reading performance. Please feel free to ask any questions about this report. You are an important part of Betty's reading success.

Stanine Description

A stanine score converts a raw score (total number correct) to a single-digit number between 1 and 9, which makes test performance easier to understand. If the stanine score is 1, 2, or 3, the test performance is considered below average or reflects a weak performance on the specific set of tasks or subtests. If the stanine score is 4, 5, or 6, the test performance is considered average. If the stanine score is 7, 8, or 9, the test performance is considered above average and reflects strong performance. Looking at stanine scores helps readily identify reading strengths and/or needs.

The **Vocabulary Composite** measures the ability to decode phonetically regular words, to recognize common sight words, and to understand word meaning without the benefit of contextual clues. Betty's average performance on the Vocabulary Composite indicates a knowledge of phonics, the exceptions to letter-sound correspondence rules, and the ability both to read words and know their meanings.

The **Comprehension Composite** measures the ability to comprehend a sentence as a whole unit as well as multiple sentences in an extended reading passage. Betty's average performance indicates an ability to read and comprehend a sentence as a whole thought, regardless of the part of speech of the missing word or the complexity of the sentence structure, as well as an ability to comprehend a variety of material and successfully apply strategies to the comprehension of written material.

The **Total Test** raw score can be converted to multiple normative or derived scores for overall reading skill assessment. Betty's average Total Test performance suggests appropriate progress in reading.

Listening Comprehension measures linguistic understanding without printed cues. Betty's average performance indicates oral language skills commensurate with the development level represented for Level 1.

Growth Scale Value (GSV)

GSV Description

The **Growth Scale Value (GSV)** is a score that tracks reading progress over time. Much like "inches" are an equal-interval scale of length, the GSV is an equal-interval scale of reading ability. Therefore, the GSV can be used as a "yardstick" by which reading progress can be measured throughout the school years. It can also be used to compare a student's reading ability to a reference group of all the students in a particular grade. For example, a GSV score of 340 is average for first-grade students in the fall; a GSV of less than 303 would reflect a lower reading performance and a GSV greater than 377 would reflect a higher reading performance for first-grade students in the fall. On this administration of the GRADE Betty obtained a GSV of 348.

Betty recently took the Group Reading Assessment and Diagnostic Evaluation (GRADE). The GRADE is a diagnostic tool designed to see what pre-reading or reading skills have been learned and what skills need to be taught. The information in the boxes below shows Betty's test results. For example, a GSV score of 340 is average for first-grade students in the fall; a GSV of less than 303 would reflect a lower reading performance and a GSV greater than 377 would reflect a higher reading performance for first-grade students in the fall. **On this administration of the GRADE Betty obtained a GSV of 348.**

score (total number correct) to a single-digit performance easier to understand. If the score is considered below average or reflects a subtests. If the stanine score is 4, 5, or 6, the stanine score is 7, 8, or 9, the test reflects strong performance. Looking at and/or needs. ability to decode phonetically regular word meaning without the Vocabulary Composite correspondence rules, and comprehend a reading passage. A sentence as a complexity of the and successfully derived

the GSV can be used as a "yardstick" by which reading progress can be measured throughout the school years. It can also be used to compare a student's reading ability to a reference group of all the students in a particular grade. For example, a GSV score of 340 is average for first-grade students in the fall; a GSV of less than 303 would reflect a lower reading performance and a GSV greater than 377 would reflect a higher reading performance for first-grade students in the fall. **On this administration of the GRADE Betty obtained a GSV of 348.**

What is the Growth Scale Value (GSV)?

The **Growth Scale Value (GSV)** is a score that tracks reading progress over time. Much like "inches" are an equal-interval scale of length, the GSV is an equal-interval scale of reading ability. Therefore, the GSV can be used as a "yardstick" by which reading progress can be measured throughout the school years. It can also be used to compare a student's reading ability to a reference group of all the students in a particular grade. For example, a GSV score of 455 is average for fifth-grade students in the fall; a GSV of less than 455 would reflect a lower reading performance and a GSV greater than 455 would reflect a higher reading performance for beginning fifth-graders.

Student GSV(s) and the Normal Growth Curve

* Gray band represents +/- 1 Standard Deviation of the standardization sample.

Administrations of the GRADE

Seq.	Date	Grade	Level	GSV	National Mean	Range
